Evaluation Plan

How Northstar would know the initiative improved AI-assisted work - not just course completion.

Headline measures

Quality of AI-Assisted Work + Time-to-Acceptable-Output

Supporting indicators: confidence/judgment, rework, responsible use, and performance-support adoption.

Confidence & Judgment

Pre/post pulse + scenario

Decide when/how to use AI
Evaluate output before use
Know when to seek guidance

Work Quality

Scenario + manager observation

Accuracy and completeness
Important context preserved
Fewer outputs passed forward unchanged

Workflow Efficiency

Repeatable task review

Stronger first drafts
Less substantial rework
Faster acceptable work products

Responsible Use

Scenario + pulse + trends

Better privacy decisions
Earlier detection of issues
Appropriate escalation

Support Adoption

Resource use + employee feedback

Quick Reference is useful
Prompt Library reduces friction
Employees work more independently

Measurement Timeline & Interpretation

Evaluation focuses on behavior and performance, with confidence used as a supporting indicator.

Before
Confidence baseline

Immediately
Scenario performance + post pulse

~30 days
Resource feedback + behavior pulse

60-90 days
Manager observation + task comparison

~6 months
Sustained quality, efficiency, and use

Confidence pulse

1-5 scale: Strongly Disagree → Strongly Agree

- I feel confident deciding when and how to use generative AI.
- I feel confident evaluating AI-generated work before using or sharing it.
- I know when I can proceed independently and when I should seek guidance.

Manager observation

Observable behavior, not satisfaction

- Work products are more consistent.
- Employees refine AI output instead of passing it forward unchanged.
- Important facts, context, and uncertainty are preserved.
- Employees know when verification or SME guidance is needed.

Interpretation note

More issues caught during review can be a positive signal.

The undesirable outcome is preventable AI-related problems reaching downstream work. Success means issues are detected earlier, corrected earlier, and fewer reach final work.
